

Meeting 2

Team member: Xin Shen Uid:u6498962

Team member: Shaocong Uid:u6499863

Time: 2020.5.17

Method: ZOOM

Duration: 3 hours

Meeting content:

1. Some problems in the submission.

Since there is no consideration when creating the file, the branches cannot be merged together when committing. So we re-created a file and migrated the content.

2. Check the default operation.

By running the program, we checked the default programs one by one.

We have temporarily completed:

Adding / deleting an meeting event

Timeslot preference submission from a (registered / unregistered) user

Visualizing scheduling results

Setting deadline for scheduling

3. Unfinished basic operations.

In the first meeting, we still left the following default operations:

Storing the scheduling results on a proper server

By reading carefully again, we found a description of sever. There is flexibility for the server part using different options, for example, PHP, Google Firebase, or third-party services. So we will proceed from this angle to complete this default function.

4. Discuss advanced features.

Scheduling with different meeting rooms

Our idea is to add suitable time for each user to the meeting, and use the time available to decide what meeting to attend.

Scheduling multiple meetings at once

To operate multiple conferences at the same time, we will use the multi-select function after a long press on a conference, and users can delete multiple conferences at the same time.

Other advanced features of scheduling

For some other advanced functions, we are going to add a reminder function to tell users to prepare for the meeting within a period of time before the meeting starts. And let customers add some comments to their meetings.

Future plans:

In the next week, spend more time to complete all functions. Leave more time to complete the remaining tasks.
